About Tumbo

Tumbo is a South African digital community empowerment platform dedicated to transforming how communities, businesses, governments, and development partners connect. We provide a unified digital ecosystem that enables trusted data collection, digital identity, artificial intelligence, and community-driven services.

Our platform addresses one of Africa's greatest challenges: fragmented and unverified community data. By enabling citizens to register once, verify their information once, and securely access multiple services, Tumbo creates a trusted digital infrastructure that benefits everyone.

Built in South Africa for African communities, Tumbo combines innovation, inclusivity, and responsible AI to improve service delivery, economic participation, and community development.

Mission

To build and operate digital infrastructure that enables African communities, businesses, governments, and development partners to collaborate using verified data, in their own languages and on their own terms.

Vision

An Africa where every community is digitally connected to opportunities, services, and partners that improve lives through trusted technology and verified data.

Values

- **Community first.** If a feature does not improve a community member's life, it does not ship.
- **Verified, not assumed.** Every data point we publish has a verification trail.
- **Consent is sacred.** POPIA is the floor, not the ceiling. Users always know what their data is used for and can withdraw consent at any time.
- **Built here, owned here.** South African team, South African data residency, South African accountability.

- **Inclusion by design.** Eleven languages, voice-first, offline-capable, low-bandwidth.
